MonoSol is a world leader in manufacturing water soluble films and solutions made for convenience, efficiency and safety - supplying water soluble laundry products worldwide since 1985.

AquaFilm is a fully soluble bag and Dissolvo-Sack is a partially-soluble seamed bag - both created to meet healthcare guidelines ensuring safe isolation, transportation, and disinfections of soiled and compromised linens.

The Patients Clothing Bag is part of MonoSol AF's established dissolve range and extends the sealed unit principle into the home washing environment.

Disappearing laundry bags

This bag now gives the option to provide patients and their

relatives with a bag specifically designed for a domestic washing machine that will give the same infection control benefits as the larger Dissolvo Sack.

The clothes are bagged and sealed with the supplied soluble pink tie tape, eliminating any unnecessary handling of soiled or infected garments. This not only reduces the risk of cross infection but also the unpleasantness associated with handling used linen.

The Patients Clothing Bag is suitable for both cold and hot washes and due to the smaller

size of the bag is ideal for the more economical domestic washing machines. The smaller size of the bag is also suited to single garment laundering in ward situations allowing for individual clothing items to be easily washed and returned.

Patients Clothing Bags include easy to follow instructions printed on each bag. They are available in compact dispenser boxes of 100 bags via NHS Supply Chain (MVF010) and are designed to conform to linen segregation standards.

ENQUIRY NO. 651

A new handbook that provides consultants with everything they need to know about delivering an effective on-premises laundry (OPL) solution has been launched by UniMac, a brand of Alliance Laundry Systems, a leader in commercial laundry systems and solutions.

The UniMac 'Expert' folder is a highly detailed document that explores such critical areas as laundry design, analyses of laundry operations, and a breakdown of products available within the UniMac range with full bid and technical specifications. It is aimed at key OPL segments, including healthcare facilities.

David Grendysa, brand manager international - UniMac, says that the folder is designed to give consultants everything they need to know to plan, specify and install an OPL laundry solution: "The folder does not 'assume'

Handbook for on-premises laundry

knowledge," he says, "and is relevant both to the experienced OPL professional as well as consultants who may be new to the OPL environment and its complexities.

"Our role is to give consultants the expert advice they need to plan a new facility, and a clear understanding of the full range of UniMac equipment that is at their disposal so that we exceed the expectation of the consultant and their customer at every touch

point."

The level of detail is exhaustive: template layouts of OPL environments are included, for example, depending on the volume of output required and the size of the facility; data is also included with appropriate analysis on such critical factors as moisture extraction, plumbing layouts and dynamic loads.

Machine dimensions and specifications of all UniMac products are also included, alongside practical summaries of its washer/extractors, barrier washers, tumble dryers and drying ironers to highlight specific features and benefits that the consultant may be looking for, and that they can simply copy and paste into their own

documentation.

"UniMac is able to deliver equipment and solutions that are proven in the market and that have become the number one choice for OPL professionals worldwide," adds David.

"Standing behind our equipment, however, is a team of true laundry experts who have used their expertise to produce a new handbook that we believe will become the essential companion for anyone that is serious about laundry design."

The UniMac 'Expert' folder is available in both printed and electronic versions.
